Our cities are rapidly transforming into artificial ecosystems of interconnected and interdependent intelligent digital organisms. Fast urbanization plays an integral role in economic and societal progress which represents the fundamentals of new technological condition confronting architects and product designers. Traffic congestion, energy usage, public safety and establishing sustainable communities are the few key challenges faced by cities. As such, development and implementations of intelligent solutions are needed.

Smart cities are measured by the integration of their infrastructure and the intelligent solutions which they tackle challenges. Constant attention to providing a better quality of life and vibrant economic climate is essential to engage and attract new residents, businesses and visitors. Our Intelligent Light Control System (iLCS) introduces a modular approach, with the energy saving generated by remote controls for street lightings. This will create a new neural infrastructure network ready to obtain and collect necessary data to activate intelligent solutions.

## GLOBAL UNIQUE ADVANTAGES

### Wireless Mesh Network

- Auto mesh networking between Light Control Unit (LCU)
- Low latency communication with response <1 second, thousands of luminaires could be turned on in a few milliseconds
- Message priority (QOS), messages with high priority are delivered and goes through the network before others
- Same platform for street lighting-industrial-indoor

### Plug and Play GPS Mapping

- LCUs embedded with GPS, automatic geolocation of light point
- Real time clock on LCU directly synchronized with GPS satellites
- Sunset and sunrise time is automatically calculated from the GPS coordinates directly in LCU
- Autonomous operation with weekly profile considering GPS coordinates and astronomical clock

### Real Time Control, Metering and Alerts

- Real time control of each luminaire
- Dimming for exact consumption
- Real time measurements of consumption
- Real time alerts provide information on luminaire failure, tracking abnormal energy use
- Detailed working time counters

### Installation Features

- Possibility to use a portable device to turn on/off/dim manually a certain area of nodes for diagnostics or installation purposes
- Factory default profile with autonomous weekly program
- External input sensors (3 ADC 0-30V dynamic range)
- Controlled auxiliary output (for advertisement displays)
